                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             27-APR-1999;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel i-antigen polypeptides and polynucleotides from Ichthyophthirius multifiliis, useful for prophylaxis and treatment of Ichthyophthirius
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               17-MAR-1999;
                                    vaccines comprising a portion of the amplified product encoding an antigenic i-antigen polypeptide obtained is also useful for treating or antigenic i-antigen polypeptide obtained is also useful for treating or antigenic i-antigen polypeptide obtained is also useful for treating or antigenic in the infection in fish. Sequences AAA97043-A97042, and AAA97066, AAA97065 and AAA97089 represent i-antigen genes and gene fragments identified in the invention. Sequences AAA97043-A97064 (excluding AAA97060) and AAA97071-A97088 represent primers used in the isolation of the i-antigen gene sequences. Sequences AAB25859-B25889 and AAB25893-B25906 represent i-antigen protein and peptide sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                               Claim 5; Figure 3; 144pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           AAA52136;
            Tetrahymena thermophila expresses two major beta-tubulin genes (BTU1 and BTU2), which encode identical beta-tubulin proteins. Either of these two genes (but not both at once) can be disrupted without a detectable change in the cell phenotype. A K350L substitution in the BTU1 beta-tubulin protein confers increased resistance to microtubule-depolymerizing drugs and increased sensitivity to paclitaxel, a microtubule-stabilizing drugs and increased sensitivity to paclitaxel, a microtubule-stabilizing drugs and increased sensitivity of paclitaxel, a microtubule-stabilizing drugs and increased sensitivity to paclitaxel, a microtubule-stabilizing drugs and increased sensitivity to paclitaxel, a microtubule stabilizing drugs and increased sensitivity of selection. Where replacement of Btu1-1K350M with a wild-type BTU1 gene fragment, eliminating the need to incorporate a means for positive selection. Where the host organism is not a T. thermophila mutant containing the Btu1-1K350M allele, BTU1::neol construct, which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  WO200046381-A1.

```
parmomycin) for that of BTU1, can be used to generate BTU1 gene knockouts and for positive selection. Heterologous nucleic acids (especially encoding antigenic polypeptides) can be inserted into a BTU gene for successful cell-surface expression that is maintained by way of negative selection. Preferred expression vectors disrupt the Btu1-IK350M gene by acid, thereby restoring resistance to paclitaxel in the resulting acid, thereby restoring resistance to paclitaxel in the resulting for stimulating an immune response in a vertebrate. The transgenic protozoan host cells are also useful for producing polyclonal antibodies multifilis immobilization-antigen (1-antigen) protein on their surface infection by I multifilis immobilization-antigen (1-antigen) protein on their surface infection by I multifilis.
infection by I. multifiliis.

Novel i-antigen polypeptides and polymucleotides from Ichthyophthirius multifiliis, useful for prophylaxis and treatment of Ichthyophthirius infection in figh

Disclosure; Figure 2; 144pp; English

environmental stimuli. This invention relates to i-ant Ichthyophthirius multifillis, a protozoan which is an This invention relates to novel i-antigen polypeptide sequences. J-antigens or immobilisation antigens ar common to a variety of hymenostomatid ciliates and their expression varies in response to environmental stimuli. This invention relates to i-antigens in obligate parasite

> ភិក្ខុសិក្ខិសិក្ខិសិក្ខិសិក្ខិសិក្ខិសិក្ខិសិក្ខិសិក្ខិ of freshwater fish causing ichthyophthiriasis or white spot disease. The cinvention includes two polypeptide and polymucleotide sequences for two i-antigens, of 48 and 55 kD. Also included in the invention are cantibodies capable of binding to the nucleotide sequences and a method for identifying I multifiliis scrotypes using the nucleotide sequences. Composition (containing the i-antigen nucleotide) capable of eliciting controlling I multifiliis infection in fish. Polymucleotide or protein controlling I multifiliis infection in fish. Polymucleotide or protein controlling I multifiliis infection in fish. Polymucleotide or protein cantigen polypeptide obtained is also useful for treating or controlling I multifiliis infection in fish. Sequences AAA97042, and AAA97065, AAA97065 and AAA97080 represent i-antigen genes and gene (excluding AAA9706) and AAA97071-A97088 represent primers used in the i-antigen gene sequences. Sequences AAA97043-A97064 consolution of the i-antigen gene sequences. Sequences AAA97089-B25889 and capable of the i-antigen gene sequences. Sequences AAB2589-B25889 and capable of the i-antigen gene sequences.

New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cel

Claim 1; SEQ ID NO 38408; 21pp + Sequence Listing; English.

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins 18

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                              The present invention relates to methods of diagnosing breast cancer in a patient, which comprise detecting the level of expression in a tissue sample of two or more genes selected from those shown in ABT09867.

ABT1112, where a differential expression of the genes indicates breast cancer. The methods are useful in diagnosing, treating, detecting the progression, and in monitoring treatment of breast cancer in patients progression, and in monitoring treatment of breast cancer that modulate the onset or progression of breast cancer. The breast cancer genes may be used as diagnostic markers for the prediction of identification of the malignant state of breast tissue, for confirming the type and progression of cancer, and for drug screening and assays. The present sequence is a coding sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            cytostatic; gene therapy; gene; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; breast specific gene; breast cancer; differential expression;

The invention relates to 1046 novel nucleic acids which are used as CC markers for determining the sensitivity of a cancer cell to the anticancer agent TAXOL. Cancer cells can be treated with TAXOL when CC they are shown to express one of the 242 sensitivity markers or the CC in the treatment of cancer cell growth in an individual. The markers CC in the treatment of cancer cell growth in an individual. The markers CC can be used as targets in developing anti-cancer agents such as CC developing treatments for cancer, particularly those cancers which CC display resistance to agents and exhibit expression of the markers. The CC cancer agents developed by the novel method can be used to treat CC cancer. Probes based on the markers can be used to treat CC cancer. Probes based on the markers can be used to detect transcripts or CC cells or tissues which mis-express the protein. Cancers which mis-express the protein. Cancers which markers can be used to treat CC cells or tissues which mis-express the protein. Cancers which markers can cell carcinoma), immakana cle.g. fibrosarcoma) leukaemia (e.g. squamous cell carcinoma), and contains and cle.g. squamous cell carcinoma), and contains and contains and cle.g. squamous cell carcinoma).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 RESULT 11

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; SRT; gene therapy; gene mapping; tissue typing; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   21-MAY-2001 (first entry)
                                                                                                                                                                                Sequences AAF93180 - AAF93743 represent polymucleotide sequences encoding human SRT proteins. The cDNA sequences are isolated from various different human tissue cDNA libraries. The invention relates to a method different human tissue cDNA libraries. The invention relates to a method for detecting cDNA encoding an SRT protein, a vector containing cDNA encoding SRT, a host cell transformed with the vector, an isolated SRT encoding SRT, and an antibody which binds to SRT. The polymucleotide polypeptide, and an antibody which binds to SRT. The polymucleotide sequence can be used in gene therapy and is useful in the recombinant sequence of SRT polypeptides, as a hybridisation probe to screen production of SRT polypeptides, as a hybridisation probe to screen libraries to isolate cDNAs with sequence identity to SRT polypeptides, to libraries to isolate cDNAs with sequence identity to SRT polypeptides, to libraries to isolate cDNAs with sequence identity to SRT polypeptides, to map the gene encoding the SRT polypeptides and analysing genetic disorders, tissue typing and disease tissue detection. The SRT polypeptides can be used in polymerase chain reaction, screening for new therapeutic molecules and generation of antisense RNA and RNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  26-JUL-1999; 99US-0145701.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABJ30511), expressed DNA discloses genomic DNA sequences (ABL16176-ABJ30511),
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Venter JC,

                                                                                                                                                                                                                      The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      23-MAR-2000; 2000US-191637P.

  Pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Score
